Nest Hub Max vs. Echo Show

Smart displays have become very much mainstream over the last year. The most popular being from a couple of the biggest companies on the planet, Google and Amazon. And for good reason. Both have a 10" display (10.1 on the Echo), both are 1200x800 resolution, and both are well equipped with smart assistants.

Although both of these are very similar, there are a couple of key differences that may have you leaning towards one over the other. In our opinion, you will be very happy unwrapping and setting up either one of these. Take a look at some of those differences below.

Smart Home Control & Support

Google's Nest Hub currently tops out at being compatible with 30,000 smart home gadgets. Although this is the first and only edition of the Nest, Google is working on adding more devices to their list of compatibility.

Video Streaming

In addition to streaming services such as CNBC, Daily Motion, Vimeo, and even Prime Video, the Nest also supports YouTube, YouTube TV, Sling TV and comes with built-in Chromecast. The Chromecast can be used to cast Netflix to your TVs through voice command.

Smart Home Control & Support

The Echo Show definitely wins this race with currently being compatible with a whopping 85,000 smart home devices. If a smart home is what you're seeking, the Show will be your controller.

Video Streaming

CNBC, Daily Motion, Vimeo, and of course Amazon Prime Video are some of the supported streaming services currently available. If you are wanting YouTube or Sling, you'll have to look elsewhere (like the Nest Hub)
